

<p>1. The first step in the process of identifying a problem is to recognize that a problem exists. This is often done by comparing current performance with a desired state or goal. If there is a significant difference, a problem is identified.</p> <p>2. The second step is to define the problem. This involves identifying the specific aspects of the problem that need to be addressed. This can be done by asking questions such as "What is the problem?" and "What are the symptoms?"</p> <p>3. The third step is to analyze the problem. This involves identifying the causes of the problem and determining the scope of the problem. This can be done by asking questions such as "What are the causes of the problem?" and "How big is the problem?"</p> <p>4. The fourth step is to develop a solution. This involves identifying the best way to solve the problem. This can be done by asking questions such as "What are the possible solutions?" and "Which solution is the best?"</p> <p>5. The fifth step is to implement the solution. This involves putting the solution into action. This can be done by asking questions such as "What are the steps to implement the solution?" and "Who is responsible for implementing the solution?"</p> <p>6. The sixth step is to evaluate the solution. This involves determining whether the solution has been successful. This can be done by asking questions such as "Has the problem been solved?" and "What are the results of the solution?"</p>	<p>1.
